### Introduction

A key element that our research reveals is the prevalence of the basic approach. For development; first entered into NSI and later converted into Framework Change also smart specialization. You can think ahead of the coronavirus pandemic in an emergency. The focus is on framework changes as framework interdependencies and shocks prove insufficient for smaller scale financial instruments. Another element continues to spotlight university-industry collaboration under various progressive brands, such as the commercialization of public research, the innovation movement, the information movement, or more recently, the Information Triangle and Co-Creation. That's it. A notable third element of the first two findings is the change from a very long-lasting and effective theme to an evolving environment.

### Description

Special training techniques (with information triangle) for pioneers at the heart of the development economy. Second, if the term reconciliation has a temporary remedial (design) perspective, it can also pass data on the actual reasonable changes. Sophisticated strategies for assessing conditions, including general acceptance of the results achieved, were thought to separate surface-level changes in the STI strategy from truly significant approach changes, and the results introduced were Robust for additional use by superiors. The fourth element is the development of new strategic interests and the adoption of new fringe work. Cultural contribution in financing strategy, environment and ecology, especially since the late digitization. WP TIP is L.

Discover insightful information and a verifiable record of the impact of the financial cycle on development. In general, these results are fragmentary, but nevertheless enhance the power of semantic exploration when focusing on STI strategies. The above research currently presents a general situation where WP TIP subjects have almost three very long-term conversations in local areas of global development strategy, both in terms of topics covered and systems calculated. It suggests that you are aware of as the research corpus is limited by the WP TIP archive, the results should not be understood in this way in a fully transferable and generalizable exploratory manner. As such, a subsequent step could be to apply semantic techniques to a wider range of records relevant to development strategies, for example other OECD institutions, non-OECD global and public organizations, school literature, etc. One promising area is the correlation between STI strategy and academic history.

### Conclusion

This gives us a more comprehensive and detailed picture of his STI strategy area discussions in recent years, and identifies gaps between academia and policy rehearsals of his two networks. As nations, especially public/government services, feed data directly into these distributions and datasets, policy makers influence the flow of scientific research that utilizes this data. Thus, it is not surprising that there is a close link between politics and the scientific environment, and that the main themes of the STI strategy remain comparable over the period considered.
